## IMPORTANT NOTES:

There is an element of uncertainty and unpredictability inherent in the use and final appearance of chemical stain. The uniqueness of each installation along with the variegated hues that form within a single color is considered to be desirable when selecting Bomanite Chemical Stain. It is not uncommon to see significant yet unexpected variations in color within the same application. The use of blue and green based Bomanite Chemical Stains are not recommended for exterior applications where the moisture content of the concrete is uncontrollable.

When applied to traditional concrete or any portland cement-based product, Bomanite Chemical Stains will produce a wide range of finished colors depending on many factors; age and condition of substrate, cement color and content, moisture content, the presence of polymers or other admixtures, pozzolans such as fly ash or similar, the method of application, the dwell time allowed, finishing techniques, mix designs, curing practices and the sealer selected along with other factors. It is recommended that hard troweled, dense concrete or previously sealed surfaces be mechanically prepared by grinding prior to staining.

It is highly recommended that samples be created, viewed and approved using construction techniques and materials identical to those that will be used in the actual construction of the project. This sampling process must be completed prior to specifying the final color and appearance.
